

CONNEXIONS 4 LONDON

Streaming

C4L's Streaming connectivity services are the ideal solution for reducing your streaming costs and supplying large capacity IP Transit is the ideal choice for any company looking for high availability and low latency.

To stand out from the crowd, we have built a multi-provider resilient BGP layer 3 network across London and Manchester. By having multiple providers, we are able to ensure the best possible service for our customers. As we offer community based transit, customers are able to select the best routes for their type of business, whether it be gaming, VoIP, streaming or even web-hosting.

We have hand picked our suppliers to ensure we still have 100% network availability, in the unlikely event of a Tier 1 having core network problems. By having multiple providers with strengths in each part of the globe, this ensures your connection has the fastest route possible to any part of the globe. We have over 30Gbps of network capacity.

The IP transit we provide is completely burstable up to line speed, whether your connection is 100Mbps or 10Gbps. This gives you the ability to rely on our network to withstand most DDoS attacks, and any large spikes of traffic directed at your network, making us the best choice as a primary IP transit provider for your business. Our billing structure allows you to burst at your fixed committed rate, and will be billed using the 95th Percentile billing model.
